

Chapter 2 – Ubuntu Server Editions & System Requirements

2.1 Ubuntu Release Types

Ubuntu is released in two main versions:

Long-Term Support (LTS)

LTS releases receive security updates and maintenance for several years.

Examples:

- Ubuntu 20.04 LTS
- Ubuntu 22.04 LTS
- Ubuntu 24.04 LTS

LTS releases are recommended for:

- Production Servers
 - Enterprise Environments
 - Home Labs
 - Security Tools
 - Wazuh
 - Docker
 - Databases
-

Interim Releases

Ubuntu also publishes regular releases every six months.

Examples:

- Ubuntu 23.10
- Ubuntu 24.10

These versions include newer features but receive support for a shorter period.

They are mainly intended for developers and users who want the latest software.

2.2 Which Version Should We Use?

2.5 Download Ubuntu Server

Official Ubuntu website:

<https://releases.ubuntu.com/22.04/>

Direct ISO:

<https://releases.ubuntu.com/22.04.5/ubuntu-22.04.5-live-server-amd64.iso>

Always download Ubuntu from the official Canonical website.

2.6 Verify the Download (Optional)

After downloading, compare the ISO checksum with the value published on Ubuntu's release page.

This helps ensure that:

- The file downloaded completely.
- The ISO was not corrupted.
- The download has not been tampered with.

Verifying checksums is considered a security best practice.
